54 Acridinecarboxamide compounds.

57 The novel class of 4-carboxamidoacridines of the present invention represented by the general formula (I),

where

R₁ represents H, CH₃ or NHR₃, where R₃ is H, COCH₃, SO₂CH₃, COPh, SO₂Ph or lower alkyl optionally substituted with hydroxyl and/or amino functions;

R₂ represents H or up to two of the groups CH₃, OCH₃, halogen, CF₃, NO₂, NH₂, NHCOCH₃, and NHCOOCH₃ placed at positions 1-3 and 5-8;

Y represents C(NH)NH2, NHC(NH)NH2, or NR4R5, where each of R4 and R5 is H or lower alkyl optionally substituted with hydroxyl and/or amino functions: and

x is from 2 to 6,

and the acid addition salts thereof, possess antibacterial and antitumour properties.

ACRIDINECARBOXAMIDE COMPOUNDS

The present invention relates to novel acridine derivatives having antibacterial and antitumour properties, to methods for preparing these compounds, and to the use of the compounds as antibacterial and antitumour agents. The present invention also relates to novel compounds useful as intermediates in the preparation of the acridine derivatives of the invention.

The novel class of 4-carboxamidoacridines of the present invention is represented by the general formula (L),

15

25

5

R₁ represents H, CH₃ or NHR₃, where R₃ is H, COCH₃, SO₂CH₃, COPh, SO₂Ph or lower alkyl optionally substituted with hydroxyl and/or amino functions:

 R_2 represents H or up to two of the groups CH_3 , OCH_3 , halogen, CF_3 , NO_2 , NH_2 , $NHCOCH_3$, and $NHCOOCH_3$ placed at positions 1-3 and 5-8;

Y represents $C(NH)NH_2$, $NHC(NH)NH_2$, or NR_4R_5 , where each of R_4 and R_5 is H or lower alkyl optionally substituted with hydroxyl and/or amino functions; and

x is from 2 to 6.

20 and the acid addition salts thereof.

When R_3 , R_4 or R_5 represent lower alkyl, the group may contain from 1 to 4 carbon atoms.

A preferred subclass of these compounds of formula (1) are those where R_1 represents NH_2 , R_2 represents up to two of 1-, 5-, 6-. 7- or $8-NO_2$, 5-or 6-CH₃, and 5-C1, Y represents $NHC(NH)NH_2$, $N(CH_3)_2$, or $NHCH_2CH_2OH$ and x is 2.

Another preferred subclass of these compounds of formula (I) has the same values for R_2 , Y and x but R_1 represents H.

Four specific compounds of formula (I) are those in which,

(a) R₁ and R₂ represent H, Y represents N(CH₃)₂ and x is 2;

5

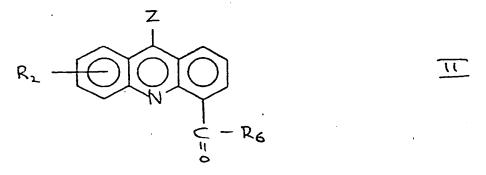

15

- (b) R_1 represents NH_2 , R_2 represents H, Y represents $N(CH_3)_2$ and x is 2;
 - (c) R_1 represents NH_2 , R_2 represents $6-NO_2$, Y represents $N(CH_3)_2$ and x is 2; and
- (d) R_1 represents NH_2 , R_2 represents 5-CH₃, Y represents $N(CH_3)_2$ and x is 2.

Other specific compounds of formula (I) are listed in Tables I and II hereinafter.

The compounds of formula (I) form pharmaceutically acceptable addition salts with both organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic, and the like.

The compounds of general formula (I) and the acid addition salts
thereof may be prepared for example by a process which comprises
coupling a substituted acridine of the general formula (II),

where R_2 is as defined as above, Z represents H, CH_3 , or any suitable leaving group (e.g. methoxy, phenoxy, alkylthio or halogen, but preferably chloro) and R_6 represents Cl. Br or

 $0C_6H_4-p-NO_2$, with a primary alkyl amine of the general formula (III),

NH2 (CH2) X

5

III

where x and Y are as defined above, and, when Z is a leaving group, converting the resultant coupled product to a compound of general formula (I) where R₁ represents NHR₃ and R₃ is as defined above, and, if desired, converting a compound of formula (I) into an acid addition salt thereof.

The coupling reaction is desirably performed in an anhydrous solvent (e.g. chloroform, dimethylsulphoxide or N-methylpyrrolidone, but preferably dichloromethane or dimethylformamide) buffered with a tertiary amine, preferably triethylamine. The reaction is conveniently performed at temperatures in the range from 0°C to 50°C, with the preferred temperature being 20°C.

- In the case of Z representing C1 in formula (II), further treatment of the resulting coupled products with anhydrous ammonia or suitable amine of the general formula R3NH2 in phenol or cresol provides the compounds of formula (I) where R1 represents NHR3. Alternatively, treating the resulting coupled products where Z=C1 with neat phenol or cresol provides corresponding compounds where Z=OC6H5 or OC6H4CH3 and R6 is NH(CH2)xY, where x and Y are defined as for formula (I). These compounds can be isolated, but are usually treated in situ with anhydrous ammonia or amine R3NH2 to provide the desired compounds of general formula (I).
- 25 The acid addition salts of the compounds of formula (I) may be prepared for example by contacting the free base form with an equivalent amount

of the desired acid in the conventional manner.

The free base forms may be regenerated by treating the salt form with a base. For example, dilute aqueous base solutions may be utilized. Dilute

5 aqueous potassium hydroxide, potassium carbonate, ammonia and sodium bicarbonate solutions are for example suitable for this purpose. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but in general the salts are otherwise equivalent to their respective free base forms for the purposes of the invention.

The primary alkyl amines of the general formula (III) are known compounds and are commercially available or preparable by methods described in the literature. Examples of such compounds include N,N-dimethyl-1,2-ethanediamine (N,N-dimethylethylenediamine), N,N-diethyl-1,2-ethanediamine, N,N-dimethyl-1,3-propanediamine, N,N-dimethyl-1,4-butanediamine, N,N-dimethyl-1,5-pentanediamine, N-(2-hydroxyethyl)-1,2-ethanediamine

20 (2-(2-aminoethylamino)-ethanol),
N-methyl-N-(2-hydroxyethyl)-1,2-ethanediamine,
2-aminoethylguanidine NH2(CH2)2NHC(NH)NH2, and
3-aminopropionamidine NH2(CH2)2C(NH)NH2. The two last-mentioned
compounds may be prepared according to P.L. Barker, P.L. Gendler,
25 and H. Rapoport, J.Org.Chem., 46, 2455 (1981).

The amines of the general formula R₃NH₂ are also known compounds, and are commercially available or preparable by methods described in the literature. Examples of such compounds where R₃ is lower alkyl optionally substituted with hydroxyl and/or amino functions include methylamine, ethylamine, 2-hydroxyethylamine, 2,3-dihydroxypropylamine, and N,N-dimethyl-1,2-ethanediamine (N,N-dimethylethylenediamine).

30

The 9-substituted acridines of formula (II) are novel compounds useful as intermediates in the preparation of the compounds of formula (I), and accordingly the present invention also provides the compounds represented by the general formula (II),

$$R_2$$
 $C - R_6$

where R_2 is defined as for formula (I), Z represents H, CH₃, or any suitable leaving group (e.g. methoxy, phenoxy, alkylthio or halogen but preferably chloro) and R_6 represents Cl, Br or OC_6H_4 -p-NO₂, and acid addition salts thereof.

The 9-substituted acridines of general formula (II) where Z represents H or halogen may be prepared for example by the process outlined in Scheme I, and this general process also forms part of the present invention. In Scheme I, R2 is as defined for formula (I), and R6 is as defined for formula (II).

Thus, for example:
The diphenylamine diacids (IV) are formed by the Jourdan-Ullmann reaction between suitably substituted 2-halobenzoic acids and anthranilic acids in high yield (see B.F. Cain, G.J. Atwell and W.A. Denny, J.Med.Chem., 20, 987 (1977) and European Patent

Application No. 82304420.1). The resulting diphenylamine diacids (IV) are cyclodehydrated with mineral acids or their derivatives (e.g. H₂SO₄, polyphosphoric acid or polyphosphate ester) to form

carboxyacridanones, from which the desired 4-carboxy isomers (V) are obtained if necessary by separation from co-occurring isomers. Such separations can readily be achieved by taking advantage of the differential solubilities of the different isomers, both as free acids and acid salts.

5

10

15

20

Alternatively, the formation of unwanted isomers in the cyclode-hydration reaction can be avoided e.g. by the process outlined in Scheme II, and this general process also forms part of the present invention. In Scheme II, R2 is as defined for formula (I), and R7 represents a lower alkyl group, i.e. containing from 1 to 4 carbon atoms, preferably methyl or t-butyl, and X is a halogen, preferably C1 or Br, or phenyl-iodonium.

The diphenylamine esters (VIII) are formed via a novel modification of the Jourdan-Ullmann reaction, in which a suitable organic base (e.g. tri-n-butylamine, N-ethylmorpholine or diisopropylethylamine) is used as both solvent and acid acceptor, thus preventing hydrolysis of the ester group. A soluble form of copper catalyst such as copper (II) acetate is used. Ring closure of the diphenylamine esters (VIII) is effected without concomitant hydrolysis of the ester function by using polyphosphate ester (PPE) as reagent. Subsequent acid- or base-catalysed hydrolysis of the acridone esters (IX) gives the desired products (V).

25 The acridone esters represented by the general formula (IX),

where R_2 is as defined for formula (I) and R_7 represents a lower alkyl group, preferably methyl or t-butyl, are novel compounds useful as intermediates in the preparation of the compounds of formula (I), and they and their acid addition salts accordingly form part of the present invention.

An alternative preparation of the 4-carboxy compounds of formula (V) is outlined in Scheme III, and this general process also forms part of the present invention. In Scheme III, R_2 is as defined for formula (I) and X represents halogen but preferably iodo.

Thus, for example:

5

10

15

20

Reaction of the halodiacid with the appropriately substituted amine is carried out in an anhydrous solvent such as N-methylpyrrolidone or dimethylsulphoxide (DMSO), but preferably dimethylformamide (DMF), in the presence of acid acceptors such as K2CO3 and organic bases (preferably N-ethylmorpholine) and Cu powder to give the N-substituted diacid (XI). These are conveniently isolated by diluting the reaction mixture with water and extracting with suitable organic solvents, preferably ethyl acetate. The resulting diphenylamine diacids are cyclodehydrated

with mineral acids or their derivatives as described above to form carboxyacridanones, from which the desired 4-carboxyacridanones (V) are obtained if necessary by separation from co-occurring isomers as described above.

Reduction of the substituted 4-carboxyacridanones (V) to substi-5 tuted 4-carboxyacridines (VI, Z=H), in Scheme I, can be achieved e.g. by direct treatment with Al/Hg amaigam (A. Albert and E. Ritchie, J.Soc.Chem Ind., 60, 120 (1941), or by formation of the tosylhydrazide adduct (VI, Z=NHNHSO₂C₆H₄CH₃) via the corresponding 9-chlorocompound, (VI, Z=C1), and subsequent base-10 catalyzed decomposition of the adduct (A. Albert and A. Royer, J.Chem.Soc., 1148, (1949)). Reaction of the 4-carboxyacridanones (V) with tris(4-nitrophenyl)phosphite in pyridine gives the 4-nitrophenylester derivatives (VII) (B.F. Cain, G.J. Atwell and W.A. Denny, J.Med.Chem., 20, 987 (1977). Similar reaction of the 15 4-carboxyacridines (VI, Z=H) with tris (4-nitrophenyl)phosphite in pyridine gives the compounds of general formula (II) where Z is H and R_6 is $OC_6H_4-p-NO_2$.

Compounds of general formula (Y) can e.g. be activated by reaction with a suitable halogen reagent (e.g. PCl₅, POCl₃, but preferably SOCl₂) and a trace of DMF as catalyst to provide compounds of formula (II) where Z is Cl and R₆ is Cl. Similar activation of compounds of general formula (VI) provides compounds of formula (II) where Z is H and R₆ is Cl. Similar activation of compounds of general formula (VII) provides compounds of general formula (II) where Z is Cl and R₆ is OC₆H₄-p-NO₂.

Similar activation of compounds of general formula (V), (VI) or (VII) with POBr3 or preferably $SOBr_2$ provides compounds of formula (II) where Z is Br and R₆ is Br, Z is H and R₆ is Br, or Z is Br and R₆ is $OC_6H_4-p-NO_2$.

30

These compounds of general formula (II) where Z is H, Cl or Br can then be reacted with amines of general formula (III) e.g. in

anhydrous solvents (e.g. CHCl3, DMSO or N-methylpyrrolidone, but preferably CH_2Cl_2 or DMF) buffered with a tertiary amine (preferably triethylamine).

The method of preparation when an amine of formula (III) is reacted with a compound of formula (II) where R₆ is OC₆H₄-p-NO₂ is the preferred method when the sidechain component (III) contains, in addition to the primary amine, other secondary amine or hydroxylated amine functions Y.

5

The compounds of general formula (II) where Z is alkylthic can be prepared for example by the methods cited in E.F. Elslager et al., J.Med.Chem., 14, 782-788 (1971), and the resultant products from the coupling reaction with amines of general formula (III) can for example be converted to compounds of formula (I) where R₁ is NHR₃ by the methods also cited therein.

The compounds of general formula (II) where Z is methoxy or phenoxy can be prepared for example by the methods given in Albert, "The Acridines", Second Edition, Edward Arnold Ltd, London (1966).

Other compounds of the general formula II where Z is a leaving group other than the ones specifically listed above may be formed by methods known to the man skilled in the art, for example, where appropriate, by the methods described above.

20

The 9-substituted acridines of general formula (II) wherein Z represents CH₃ may be prepared e.g. by the process outlined in Scheme IV, and this general process also forms part of the present invention. In Scheme IV, X represents halogen but preferably bromo, R₂ and R₆ are as defined for formula (II) and R₈ is as defined below.

Thus, for example:

30

Reaction of suitably substituted 2-haloacetophenones with anthranilic acid in the presence of 1 mole of acid acceptor (preferably potassium carbonate) and a catalytic amount of copper gives the diphenylamine products (XII), where Rg is OH. Reaction of the ketoacids (XII; $R_8 = OH$) with a suitable lower alcohol (preferably ethanol) using 1 mole of diethyl phosphorocyanidate (DEPC) or other suitable ester-forming reagents and 1 mole of acid acceptor, preferably triethylamine, gives compounds (XII, R₈=OCH₂CH₃). Cyclodehydration, for example using 5% H_2SO_4 in refluxing acetic 10 acid, provides compounds (XIII; R₈=0CH₂CH₃), which can be hydrolyzed in dilute ethanolic sodium hydroxide to the acid (XIII; $R_8=OH$). Activation of these compounds with a suitable halogen reagent (preferably SOC12 or SOBr2) as detailed above provides compounds of general formula (II) where Z is CH3 and R_6 is Cl or 15 Reaction of the acid (XIII; Rg=OH) with tris(4-nitrophenyl)phosphite in pyridine gives the 4-nitrophenylester derivatives (II'; $R_6=0C_6H_4-p-N0_2$) (B.F. Cain, G.J. Atwell and W.A. Denny, <u>J.Med.Chem.</u>, <u>20</u>, 987 (1977).

The compounds of general formula (II) where Z is CH₃ and R₆ is Cl.

Br or CC₆H₄-p-NO₂ may then be coupled with suitable primary amines of general formula (III) e.g. in anhydrous solvent (e.g. CHCl₃, DMSO or N-methylpyrrolidone, but preferably CH₂Cl₂ or DMF) buffered with a tertiary amine (preferably triethylamine) to provide compounds of general formula (I) where R₁ is CH₃.

An alternative and preferred process for the preparation of compounds of general formula (I) where R_1 is CH_3 and R_2 is defined as for formula (I) is outlined in Scheme V, and this is also a process of the present invention. In Scheme V, X represents halogen but preferably bromo, R_2 and Y are as defined for formula (I) and R_R is as defined below.

Reaction of suitably substituted 2-haloacetophenones with anthranilic acid in the presence of 1 mole of acid acceptor (preferably potassium carbonate) and a catalytic amount of copper gives the diphenylamine products (XII), where Rg is OH. These compounds can be coupled with a primary alkyl amine of general formula (III) in anhydrous solvents (e.g. N-methylpyrrolidone or N-methyl acetamide but preferably DMF) using 1 mole of diethyl phosphorocyanidate or other suitable amide-forming reagent and 1 mole of an acid acceptor, preferably anhydrous triethylamine to give compounds (XII), where Rg is NH(CH₂)_xY. Cyclodehydration of these compounds, for example using 5% H₂SO₄ in refluxing acetic acid, gives the required compounds of general formula (I), where R₁ is CH₃.

- In the various processes described above, the compounds of the general formulae II to XIII may, where appropriate, be used in the form of their acid addition salts or in the form of their salts with bases.
- In the formulae shown above, R₂ represents H or one or two of the same or different substituents selected from CH₃, OCH₃, halogen, CF₃, NO₂, NH₂, NHCOCH₃ and NHCOOCH₃. It will be appreciated that, although the formulae show R₂ as a substituent of one ring of the accidine and diphenylamine derivatives of the

general formulae I, II, IV to IX, XI and XII, when R₂ represents one substituent this may occur on either of the rings and when R₂ represents two substituents these may occur on either or both rings. Thus, for a substituted acridine derivative, the substituent(s) may be at any one or two of the free positions on the rings, i.e. positions 1-3 and 5-8; substituent(s), when present, are correspondingly situated on either or both of the phenyl rings of formulae IV, VIII, XI and XII and these compounds may be derived from appropriately substituted starting materials.

The following Tables I and II set out physical data for 24 compounds within the general formula (I), representative of it, and preparable by the processes of the invention. In Table I the following terms and abbreviations are used:-

- MP = melting point of the reported acid addition salt in °C.
- Rm = a measure of the compound's lipophilic-hydrophilic
 balance from reversed phase partition chromatography.
 Rm is linearly related to partition coefficients
 obtained in the 1-octanol/water system.

The following Examples illustrate the preparation of compounds of the general formula (I):

EXAMPLE A: Preparation of compound 4 of Table I by the method of Scheme I

- N-(2-Carboxyphenyl)anthranilic Acid (IV, $R_2=H$) 5 A mixture of 2-chlorobenzoic acid (100g), anthranilic acid (90g), anhydrous powered K_2CO_3 (135g), Cu/CuO (2g) and 2-ethoxyethanol (200 m) was heated with swirling on the steam bath until gas evoluxion ceased and then stirred at 145° for a further 21/2 hours. The thick reaction mixture was diluted with water, acidified 10 (HCI) and then the crude product was collected and washed well
- with hot water. This was dissolved in hot dilute aqueous Na₂CO₃ treated liberally with charcoal-celite and filtered through a celite pad. The hot filtrate was diluted with half the volume of EtOH and then slowly acidified (HCl). The pale yellow product which separated was collected when still warm, washed well with hot water, benzene and dried, providing material (84% yield) of sufficient purity for use in the next step (lit, m.p. 295° dec.).
- 9(10H)Acridone-4-carboxylic Acid (V, R₂=H) A mixture of the preceding diphenylamine diacid (80g) and conc. $\rm H_2SO_4$ (250ml) was heated at 100°C for 4 hours, then cooled, poured into ice-water and the precipitated solid collected and washed well with water. This was dissolved in dilute aqueous NaOH and following filtration was diluted with an equal volume of 25 EtOH and then acidified with glacial acetic acid (this left any sulfonated impurities in solution). The acridone acid which slowly crystallized from the hot solution was collected after thorough cooling, washed with EtOH, water, EtOH again and dried

providing pure material in 83% yield m.p. 342-343° dec.

20

30

9-Chloroacridine-4-carbonyl chloride (II, R2=H, Z=Cl; R6=Cl) A suspension of the preceding acridone acid (20g) in SOC12 (60ml) containing DMF (2 drops) was heated gently under reflux with

stirring until homogeneous and then for a further 45 min. The solution was evaporated to dryness in vacuo, below 40°C, and residual traces of SOCl₂ were removed by addition of dry benzene and complete re-evaporation of all solvents to give the crude product as a yellow powder.

N-[2-(dimethylamino)ethyl] 9-chloroacridine-4-carboxamide (II, R₂=H, Z=Cl, R₆=NH(CH₂)₂ N(CH₃)₂.

The above carbonyl chloride was cooled to -5° and to this was added in one portion an ice-cold solution of

- N,N-dimethylethylenediamine (36.5ml) in dry dichloromethane (200ml). After stirring at 30°C until homogeneous the reaction solution was left for a further 15min and then shaken with dilute aq. Na₂CO₃. The organic layer was washed with dilute aq. Na₂CO₃ (2x), aq. NaCl solution and then dried (Na₂SO₄). Evaporation of
- the solvent left an oil which slowly solidified. This was extracted with hot dry benzene-petroleum ether (1:5), treated with charcoal-celite and filtered quickly through a hot celite pad. Crystalline material rapidly separated and addition of further petroleum ether completed precipitation of the product.
- The yellow solid was collected, washed with petroleum ether and dried providing material 19.5g (71% yield) indicated by TLC to contain only trace quantities of the corresponding acridone and this product was stored over KOH and used without further purification.

25 Compound 4 of Table 1

The above compound (II; R₂=H, Z=Cl, R₆=NH(CH₂)₂N(CH₃)₂ (4.0g) was dissolved in dry phenol (12.8g) and heated slowly to 50°C, to provide a solution of the phenoxy compound (II; R₂=H, Z=OC₆H₅), R₆=NH(CH₂)₂ NH(CH₃)₂) in excess phenol. A stream of dry ammonia was passed into the solution while the temperature was raised from 50°C to 115°C. Addition of ammonia was continued for 15 min, after which the mixture was cooled and diluted with excess 40% aqueous NaOH. Prolonged cooling gave a solid that was crystallized from aqueous EtOH and then EtOAc. The resulting

pure base was converted to the dihydrochloride salt by dissolving in MeOH, treating with 12N HC1 (2.2 equivalents) and precipitating with EtOAc. Crystallization from MeOH/EtOAc gave hygroscopic yellow prisms of the pure dihydrochloride of compound 4, m.p. 304-305°C (72% yield).

Minor modifications of the procedure of Example A, employing appropriately substituted 2-chlorobenzoic acids and/or appropriate amine components, were used to prepare compounds 3,5,7,8,9-15 and 18 of Table I. Separation of isomers after ring closure was sometimes required.

EXAMPLE B: Preparation of compound 1 of Table 1 by the method of Scheme I.

4-Carboxyacridine (VI; Z=H, R₂=H)

10

MSULCIU- >ED

- 4-Carboxyacridanone (V; R2=H)(5g) and NaOH (1g; 1.1 equivalent)
 were dissolved in water (100ml). Al foil (3g; amalgamated by
 dipping each piece into a solution of 15g of mercuric chloride in
 100ml of water for 5 min immediately before use) was added in
 pieces to the stirred, boiling solution of carboxyacridanone over
 30min. After a further 30min reflux, the hot solution was
- filtered and acidified with cHCl. FeCl3 (12g) was added, and the mixture was heated until clear (an initial heavy precipitate redissolves) and for a further 10mins. The mixture was basified with 2N NaOH, filtered from Fe(OH)3, and the pH adjusted to 5, when a precipitate formed. This was collected, washed with water and extracted with boiling EtOH (400ml). The filtrate was concentrated to 30ml and cooled well, yielding 4-carboxyacridine (2.2g, 47%), m.p. 202-204°C.

Compound 1 of Table I

4-Carboxyacridine (1.1g, 5.6mM) was refluxed in SOCl₂ (10ml) and a drop of DMF for 1h, and the volatiles were evaporated. Dry benzene (20ml) was added and evaporated to remove residual traces of SOCl₂, and the resulting solid was dissolved in dry DMF (20ml) containing N,N-dimethylethylenediamine (1.25g. 3 equivalents).

The mixture was kept at 20°C for 2h and the volatiles were evaporated at 40°C. The resulting gum was extracted with boiling disopropyl ether, and this solution was concentrated and diluted with petroleum ether to give the free base as yellow needles (0.85g, 61%). The free base was dissolved in MeOH and dry HCl gas added to pH2. Dilution with EtOAc gave the dihydrochloride as yellow crystals (87%), m.p. 195-197°c.

EXAMPLE C: The preparation of compounds 20 and 21 of Table I by the methods of Scheme I and Scheme II.

N-(2-methoxycarbonylphenyl)-5-nitroanthranilic acid (VIII, $R_2 = 7-NO_2$, $R_7 = CH_3$)

A mixture of 2-chloro-5-nitrobenzoic acid (7g, 35mM), methyl anthranilate (6.3g, 45mM), and cupric acetate (6.3g, 35mM) in bis-isopropylethylamine (10ml) and N-methylpyrrolidone (5ml) was stirred and heated at 150° for 2h under N2. The cooled solution was diluted with water and acidified with 2N HCl. The gummy precipitate was collected by decantation and triturated with a small amount of cold MeOH to give a yellow solid. This was collected and washed with cold MeOH to give the desired diphenylamine ester (VIII; R2 = 7-NO2, R7 = CH3) (2.6g, 24%). Crystallization from EtoAc gave yellow needles, m.p. 228-229°c.

Methyl 7-nitro-acridanone-4-carboxylate (IX, $R_2 = 7-NO_2$, $R_7 = CH_3$)

The above diphenylamine ester (2.0g) was heated at 100°C for 1h with polyphosphate ester (10g). The cooled mixture was diluted with water and basified with Na₂CO₃ to give the acridone ester, which was collected and crystallized from EtOH as yellow needles, m.p. 310-312°C (1.7g, 91% yield).

7-Nitro-4-carboxyacridanone (V, R₂=7-NO₂)

The above acridone ester (2.0g) was heated in 92% $\rm H_2SO_4$ (50ml) for 7h at 100°C. The cooled mixture was poured into water and the precipitate collected and extracted with aqueous $\rm Na_2CO_3$. The

extract was filtered and acidified with 2N HCl to provide pure product (1.72g, 90%), which was recrystallized from DMF as a yellow powder, m.p. about 375° C.

7-Nitro-4-carboxyacridanone (V; R₂ = 7-NO₂) (by direct nitration).

A stirred solution of 4-carboxyacridanone (10.0g) in c.H₂SO₄ (50ml) was treated portionwise at below 5°C with powdered KNO₃ (4.6g), then stirred for 30min at 20°C and poured into ice water. The precipitate was collected, washed, dried and crystallized from DMF/MeOH and then DMF to give pure product of m.p. about 375°C (65% yield).

The product was identical (assessed by TLC) to the compound obtained above by polyphosphate ester ring closure of N-(2-methoxycarboxylphenyl)-5-nitroanthranilic acid and subsequent acid hydrolysis of the methyl ester function.

15 Compound 20 of Table I

20

The above 7-nitro-4-carboxyacridanone was converted to 7-nitro-9-chloroacridine-4-carbonyl chloride (II, Z=Cl, R₂ = 7-NO₂, R₃ =Cl), and treated with N,N-dimethylethylenediamine followed by dry ammonia in phenol by the methods outlined in Example A above to give N-(2-dimethylaminoethyl)-9-amino-7-nitroacridine-4-carboxamide dihydrochloride (compound 20 of Table I), m.p. 316-318°C.

Compound 21 of Table I

The above nitro compound was reduced using Fe powder and HCl in 65% aqueous EtOH. Basification with 2N NaOH gave the crude product, which was converted to the trinydrochloride with 12N HCl in MeOH/EtOAc. Two recrystallizations from MeOH/EtOAc gave pure product, m.p. 324-326°C.

EXAMPLE D: Preparation of compound 6 of Table I by the method of Scheme I

6-p-Nitrophenyl acridanone-4-carboxylate. (VII; R2=H)
Pure, finely-powered acridanone-4-carboxylic acid (19.8g, 83mM)
and p-nitrophenol (22.2g, 160mM) were suspended in pyridine (200ml). The mixture was stirred vigorously at 60°C while PCl3 (4.4ml; 53mM) was added dropwise. The mixture was immediately heated to 100°C until homogeneous. On cooling product separated, and after 1h the reaction was cooled well and the precipitate collected and washed well with acetone. Recrystallization from DMF gave pure compound (74% yield), m.p. 280-281°C.

p-Nitrophenyl 9-chloroacridine-4-carboxylate (II; Z=Cl, $R_2=H$, $R_6=OC_6H_4NO_2$).

The above compound (2.02g, 5.6mM) was refluxed gently in SOC12 (6ml) and a drop of DMF for 1h. The volatiles were evaporated, dry benzene was added, and the volatiles evaporated again to remove all traces of HCl and SOC12. The residue was dissolved in CH₂Cl₂, cooled to 0°C, and icecold 10% KHCO₃ (20ml) was added. The organic layer was separated, dried, and concentrated to small volume to provide the product as yellow needles (80% yield), m.p. 194-196°C.

Compound 6 of Table I

4-Nitrophenyl 9-chloroacridine-4-carboxylate (0.01 M) was added in one portion to an ice-cooled stirred solution of

2-(2-aminoethylamino)-ethanol (0.012 M) and triethylamine (0.011 M) in anhydrous dichloromethane (20ml). The mixture was stirred until homogeneous, and then for a further 10 min. Dry phenol (11g) was then added to the solution and anhydrous ammonia was passed in while the temperature was raised to 115°C. After contact with ammonia at this temperature for a further 10 min the mixture was cooled and excess 5N aqueous NaOH added. The resulting solid was dissolved in 1N aqueous HCl and this solution was slowly neutralised with 1N aqueous NH4OH, precipitating a

34 quantity of material that was removed by filtration and

discarded. Treatment of the filtrate with excess aqueous NaOH gave crude material which was recycled through the above purification process. The resulting free base was crystallized from MeOH-H₂O. Crystallisation of the dihydrochloride salt from MeOH-EtOAc then provided pure product, m.p. 292-293°C dec.

2-(N-2-Methylcarbonylphenyl)aminobenzoic acid (XII; R₂=H, R₈=OH)

A mixture of 2-chloroacetophenone (20g, 0.18mol), anthranilic

acid (37g, 0.27mol), dry K₂CO₃ (37g, 0.27mol), Cu powder (0.1g),
and CuCl (0.1g) suspended in 50ml dimethoxyethane was stirred
under reflux for 20h and cooled. The mixture was extracted with
dilute aqueous NaOH, the solution was clarified with charcoalcelite, filtered, and acidified to give 7.4g (16%) of

2-(N-2-methylcarbonylphenyl)aminobenzoic acid, (XII; R₂=H, R₈=OH)
m.p. 280-283° decomp.(EtOH).

N-(2-Dimethylaminoethyl)-2-(N-2-methylcarbonylphenyl) aminobenzamide (XII; R_2 =H, R_8 =NH(CH₂)₂ N(CH₃)₂)

A solution of the above keto-acid in dry DMF (20ml) was treated with 2.3g (1.2 equivalents) of diethyl phosphorocyanidate (DEPC), and an excess of N,N-dimethylethylenediamine (2g) was added dropwise. After being warmed on a waterbath for 30min the reaction mixture was basified with K2CO3 (aq) and the solvent was removed under vacuum. The residue was extracted with ethyl acetate, and after being washed (H2O,brine) and dried (Na2SO4) the solvent was removed to give crude
N-(2-dimethylaminoethyl)-2-(N-2-methylcarbonylphenyl) aminobenzamide, (XII; R2=H, R8=NH(CH2)2 N(CH3)2) as an oil.

Compound 2 of Table I

The above oily product was dissolved in 25ml of a mixture of 100 parts HOAc and 5 parts H₂SO₄. After heating under reflux for 1h the HOAc was removed under vacuum and the residue was dissolved in water. The aqueous fraction was extracted with CH₂Cl₂,

basified with aqueous NaOH and extracted with EtOAc. The EtOAc layer was washed with water and saturated brine, dried and evaporated to provide

N-(2-dimethylaminoethyl)-9-methylacridine-4-carboxamide (2.1g, 60%) as an oil. This was dissolved in MeOH-EtOAc and treated with dry HCl gas to provide compound $\underline{2}$ of Table I as a crystalline dihydrochloride salt, m.p. 178-180°C (recrystallized from EtOH).

Alternative Preparation of Compound 2 of Table I by the method of Scheme IV

10 of Scheme IV Ethyl 9-methylacridine-4-carboxylate (XIII; R₂=H, R₈=0Et). To a solution of 1.2g (4.7mmol) of 2-(N-2-methylcarbonylphenyl) aminobenzoic acid in 5m1 dry DMF was added 1.15g DEPC (1.5 equivalents), ethanol (1ml) and Et3N (1.4g, 3 equivalents) and the mixture was heated on a water bath for 1h. Since the reaction was incomplete a further equivalent of each reagent was added and the mixture was heated for a further lh. The solvent was removed under vacuum, and the residue was basified with KHCO3(ac) and extracted into EtOAc. After washing and drying (Na_2SO_4) the solvent was removed to give the crude ethyl ester (XII: R_2 =H, R_8 =OEt) which was dissolved in 15ml of a mixture of ${
m HOAc}$ (100 parts) and ${
m H_2SO_4}$ (5 parts). After heating under reflux for 1h the HOAc was removed under vacuum and the residue was basified with dil KHCO3 solution, and extracted with EtOAc. The organic layer was washed with dilute aqueous methanesulphonic acid and discarded, and after being basified with dil. $KHCO_3$ solution the aqueous layer was extracted with EtOAc to give 0.31g of ethyl 9-methylacridine-4-carboxylate (XIII; R₂=H, R₈=0Et) (23%)

N-(2-Dimethylaminoethyl)-9-methylacridine-4-carboxamide. (Compound 2 of Table I).

as an oil.

The ethyl ester from above (lmmol) was treated with refluxing 1N NaOH in 20ml 60% aqueous ethanol for 1h; the solution was neutralized by the dropwise addition of conc. HCl and the solvent was

removed under vacuum. The crude acid (XIII; R₂=H, R₈=OH) was then treated with refluxing SOC1₂ for 30min, and after removal of the solvent the product acid chloride (XIII; R₂=H, R₈=C1) was dissolved in dry CH₂Cl₂. The solution was cooled in ice and an excess of N,N-dimethylethylenediamine was then added slowly. The solution was then washed well with water to remove excess amine and after being dried (Na₂SO₄) the solvent was removed to give N-(2-dimethylaminoethyl)-9-methylacridine-4-carboxamide (0.24g, 78%) as an oil. This oil was converted to the crystalline hydrochloride salt (compound 2 of Table 1), m.p. 178-180° decomp (EtOH).

EXAMPLE F: Preparation of Compound 16 of Table I by the method of Scheme II

5-Nitrodiphenyliodonium-2-carboxylate

2-Iodo-4-nitrobenzoic acid (17.5g, 0.06mol) (W.C. Agosta, Tet. Lett., 1965, 2681) was dissolved in 60ml conc H₂SO₄ and the solution was cooled to 0°C. Potassium persulphate (31.2g, 0.116mol) was added in portions with stirring over 40 min, and after a further 60min at <10°C 55ml of benzene was added. The stirred viscous mixture was then allowed to warm slowly to room temperature and left overnight. The reaction mixture was then poured onto ice, and the white precipitate was filtered off and suspended in a stirred solution of 200ml 5N NaOH. After being filtered off and washed several times with water the solid was dried by azeotroping with benzene. Yield 20.1g, 91%. The product was insoluble in all of the normal solvent systems but has some solubility in DMF.</p>

N-[2-(Methoxycarbonyl)phenyl]-4-nitro-anthranilic acid (VIII)

Crude 5-Nitrodiphenyliodonium-2-carboxylate (42g, 0.114mol) was suspended in 500ml of DMF containing 34g methyl anthranilate and 1.0g Cu(0Ac)₂, and the mixture was heated on a waterbath for 2 days when all of the solid had dissolved. The dark red-brown solution was diluted firstly with 50ml of conc NH₃, and then with 2L of water and the oily insolubles were removed by washing twice

with dichloromethane. Acidification with dilute HCl then gave the nitro ester acid, 31.3g, 86%, which was recrystallized from EtOAc as red needles, m.p. 243-245°C.

Methyl 3-nitro-9(10H)-acridanone-5-carboxylate (IX)

5 The above half ester (1.0g, 3.2mM) was heated with polyphosphate ester at 100°C for 1h. The cooled product was diluted with water and basified to pH 9. The insoluble product was collected and crystallized from ethanol as yellow prisms: m.p. 252-253°C.

3-Nitro-5-carboxy-9(10H)-acridanone (V)

- The above acridone ester (1.5g, 5.0 mM) was heated in sulphuric acid (20ml, 92% v/v) for 7h at 100°C. The cooled mixture was diluted with water, and the product collected and washed.

 Trituration with 2N aq Na₂CO₃ followed by removal of insoluble products and acidification of the filtrate gave the acid (1.29g,
 - 15 90% yield). A sample was crystallized from a large volume of EtOH, : m.p. 375°C. Attempted ester hydrolysis under basic conditions gave impure, deeply coloured products.

Compound 16 of Table I

The above 4-carboxyacridanone was converted, via the 9-chloro-4-carbonyl chloride to compound 16 of Table I, using the methods given in Example A.

EXAMPLE G: Preparation of compound 23 of Table I by the method of Scheme III

2-(4-Methoxyphenylamino)-1,3-benzenedicarboxylic acid (XI)

A mixture of 10g 2-iodoisophthalic acid (34 mmol), 8.3g p-anisidine (70mmol), 0.5g CuCl, 0.5g Cu(OAc)2, 10ml N-ethylmorpholine and 25ml DMF was heated with stirring at 125°C for 2h under nitrogen and cooled. The reaction mixture was then diluted with 100ml of dil HCl and extracted with EtOAc. The organic layer was extracted with dil NaOH solution and discarded. Acidification of the aqueous layer with dil HCl gave a precipitate of the methoxy-diacid, 8.64g, 88% m.p. 225-228°C (EtOAc).

2-Methoxy-acridanone-5-carboxylic acid (V)

The above diacid (4.3g, 30mM) was treated with polyphosphoric acid (30g) for 4h at 130°C. The cooled melt was dissolved in water and the pH was adjusted to 7.5 with aqueous NaOH to precipitate the crude acridone acid.

Compound 23 of Table I

The above crude acridanone acid was treated as outlined in Example A to provide compound 23 of Table I.

The procedure of Example G was also used with appropriate choice of starting materials to prepare compounds 19, 22 and 24 of Table I.

The compounds of general formula (I), and particularly the examples listed in Tables I and II, have antitumour activity in both <u>in vivo</u> and <u>in vitro</u> test systems, as shown by the data of Table III. This Table gives biological data for compounds 1-24, whose physical data has been given in Tables I and II. The abbreviations given in Table III are:-

P388 in vivo

Tumour P388 cells were obtained as frozen stocks from Mason Research Inc., U.S.A. and passaged intraperitoneally according to standard methods (Cancer Chemother. Rep. 3, Part 3, page 9, 1972) in DBA-2 mice of either sex. Groups of six Fl hybrid mice (DBA-2 male x C57 Bl female, g weight 20 ± 1 g) were injected intraperitoneally with 106 cells on day 0.

Tumour P388 cells were obtained as frozen stocks from Mason Research Inc., U.S.A. and passaged intraperitoneally according to standard passaged intraperitoneally according to standard passaged intraperitoneally according to standard passaged intraperitoneally with 106 cells on day 0.

Tumour P388 cells were obtained as frozen stocks from Mason Research Inc., U.S.A. and passaged intraperitoneally according to standard passaged intraperitoneally acc

20

25

30

ILS

- optimal drug dose, in milligrams per kilogram administered as a solution in 0.1 ml of 30% v/v ethyl alcohol in water on days 1, 5 and 9 after tumour inoculation. The drug is administered as a soluble acid addition salt.
- percentage increase in life span of treated animals over that of groups of control animals injected with tumour alone. The average survival of control mice was 11 days. Values of ILS greater than 20% are considered statistically significant.
- L1210 in vitro The culture methods used are described in detail elsewhere (B.C. Baguley and R. Nash, Europ.J.Cancer, 17, 671-679 (1981).

 Acceptable reproducibility of data depends critically upon the maintenance of optimal culture conditions. L1210 cells were ini-

tially obtained from Dr I. Wodinsky, Arthur D. Little Inc., Boston, U.S.A., under the auspices of the National Cancer Institute.

ID50

5

the nanomolar concentration of drug which, when added to cultures of murine L1210 leukaemic cells over a period of 70 hours, reduces the resultant counted number of leukaemia cells by 50% (B.C. Baguley and R. Nash, Europ.J.Cancer, 17, 671-679 (1981)). Values below 1000nM are considered significant.

10

The compounds of general formula (I) also show broadspectrum antibacterial activity. Specifically, compound
4 is active against the bacteria Aerobacter aerogenes,
Alcaligenes viscolactis, Escherichia coli, Bacillus
15 subtilis, Sarcina lutea, Micrococcus lysodeikticus,
Neisseria catarrhalis, Staphylococcus aureus,
Xanthomonas phaseoli and Streptococcus faecalis.

It is clear from the data of Table III that the acridine carboxamides of general formula I are active antitumour agents, giving significant levels of life extension when tested against the P388 leukaemia system when given by intraperitoneal injection, and/or significant inhibition of cultured L1210 leukaemia cells in vitro. The compounds also show antitumour activity when given by oral and intravenous routes. In addition to high cytotoxicity towards cultured L1210 leukaemia cells, they are active in a number of cultured tumour cell lines, including those originating from human breast and colon tumours.

These compounds are thus indicated for use as antitumour agents, and the present invention therefore also provides a compound of the general formula (I), or a pharmaceutically acceptable acid addition salt thereof, for use in the treatment of tumours, and especially cancers.

The present invention further provides pharmaceutical compositions having antitumour activity and comprising at least one compound of the general formula (I) or a pharmaceutically acceptable acid addition salt thereof, and one or more pharmaceutically acceptable carriers or diluents.

The active compounds may be orally administered, for example, with an inert diluent or with an assimilable edible carrier, or they may be enclosed in hard or soft shell gelatin capsules, or they may be compressed into tablets, or they may be incorporated directly with the food of the diet. For oral therapeutic administration, the active compounds may be incorporated with excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers and the like. Generally, such compositions and preparations should contain at least 0.1% of active compound. The percentage in the compositions and preparations may, of course be varied and may conveniently be from about 2% to about 60% of the weight of the unit. The amount of active compound in such therapeutically use-

ful compositions is such that a suitable dosage will be obtained. Preferred compositions or preparations according to the present invention are prepared so that an oral dosage unit form contains from about 5 to about 200 milligrams of active compound.

The tablets, troches, pills, capsules and the like may also contain, for example, one or more of the following: a binder such as gum tragacanth, acacia, corn starch or gelatin; excipients such as cicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate: and a 10 sweetening agent such a sucrose, lactose or saccharin may be added or a flavouring agent such as peppermint, oil of wintergreen or cherry flavouring. When the dosage unit form is a capsule, it may contain, e.g., in addition to materials of the above 15 type, a liquid carrier. Various other materials may be present as coatings or to otherwise modify the physical form of the dosage unit. For instance, tablets, pills or capsules may be coated with shellac, sugar or both. A syrup or elixir may contain the active compound, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavouring such as 20 cherry or orange flavour. Of course, any material used in preparing any dosage unit form should be pharmaceutically pure and substantially non-toxic in the amounts employed. In addition, , the active compounds may be incorporated into sustained-release preparations and formulations. 25

The active compounds may also be administered parenterally or intraperitoneally. Solutions of the active compound as a free base or pharmaceutically acceptable salt can be prepared in water suitably mixed with a surfactant such a hydroxpropylcellulose. Dispersons can also be prepared e.g. in glycerol, liquid polyethylene glycols, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

30

BNSDOCID: SED

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases the form must be sterile and must be 5 fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol 10 (for example, glycerol, propylene glycol, liquid polyethylene glycol, and the like), suitable mixtures thereof and vegetable oils. The proper fluidity can be maintained, for example, by the use of a coating such a lecithin, by the maintenance of the required particle size in the case of dispersion and by the use 15 of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars or sodium 20 chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminium monostearate and gelatin.

Sterile injectable solutions may be prepared by incorporating the active compound in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared incorporating the various sterilized active ingredients into a sterile vehicle which contains the basic dispersion medium and the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze-drying technique which yield a powder of the active ingredient plus any additional

desired ingredient from a previously sterile-filtered solution thereof.

As used herein, "pharmaceutically acceptable carrier" includes any and all suitable solvents, dispersion media, coatings, antibacterial and antifungalagents, isotonic and absorption delaying agents and the like. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active ingredient, its use in the therapeutic compositions is contemplated. Supplementary active ingredients can also be incorporated into the compositions.

It is especially advantageous to formulate parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suitable as unitary dosages for the mammalian subjects to be treated; each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. The specification for the novel dosage unit forms of the invention are dictated by and directly dependent on (a) the unique characteristics of the active material and the particular therapeutic effect to be achieved, and (b) the limitations inherent in the art of compounding such an active material for the treatment of disease in living subjects having a diseased condition in which bodily health is impaired as herein disclosed.

The principal active ingredient may be compounded for convenient and effective administration in effective amounts with a suitable pharmaceutically acceptable carrier in dosage unit form as 30 hereinbefore disclosed. A unit dosage form can, for example, contain the principal active compound in amounts ranging from about 0.1 to about 400 mg, with from about one to about 30 mg being preferred. Expressed in proportions, the active compound

is generally present in from about 0.1 to about 400 mg/ml of carrier. In the case of compositions containing supplementary active ingredients, the dosages are determined by reference to the usual dose and manner of administration of the said ingredients.

5

Claims for Luxembourg, Belgium, Netherlands, United Kingdom, West Germany, France, Italy, Switzerland + Liechtenstein and Sweden.

1. A compound represented by the general formula (I),

where R₁ represents H, CH₃ or NHR₃, where R₃ represents H, COCH₃, SO₂CH₃, COPh, SO₂Ph or lower alkyl unsubstituted or substituted by one or more of the same or different substituents selected from hydroxyl and amino functions;

10 R₂ represents H or up to two of the groups CH_3 , OCH_3 , halogen, CF_3 , NO_2 , NH_2 , $NHCOCH_3$ and $NHCOOCH_3$ placed at positions 1-3 and 5-8;

Y represents C(NH)NH₂, NHC(NH)NH₂, or NR₄R₅, where each of R₄ and R₅, which may be the same or different, represents H or lower alkyl unsubstituted or substituted by one or more of the same or different substituents selected from hydroxyl and amino functions; and

20 x is from 2 to 6,

or an acid addition salt thereof.

BNSDOCID: <EP nngenge#2 1 >

- 2. A compound according to Claim 1 where R_1 represents $^{\rm NH}_2$, R_2 represents up to two of 1-, 5-, 6-, 7-, and 8-NO $_2$, 5- and 6-CH $_3$, and 5-Cl, Y represents $^{\rm NHC(NH)NH}_2$, $^{\rm N(CH}_3)_2$ or $^{\rm NHCH}_2$ CH $_2$ OH and x is 2.
- 5 3. A compound according to Claim 1 where R₁ represents H, R₂ represents up to two of 1-, 5-, 6-, 7-, and 8-NO₂, 5- and 6-CH₃, and 5-Cl, Y represents NHC(NH)NH₂, N(CH₃)₂ or NHCH₂CH₂OH and x is 2.
- 4. A compound according to Claim 1 in which R₁

 and R₂ represent H, Y represents N(CH₃)₂ and x is 2.

g mad.

- 5. A compound according to Claim 1 in which R_1 represents NH_2 , R_2 represents H, Y represents $N(CH_3)_2$ and x is 2.
- 6. A compound according to Claim 1 in which R_1 represents NH_2 , R_2 represents $6-NO_2$, Y represents $N(CH_3)_2$ and x is 2.
- 5 7. A compound according to Claim 1 in which R₁ represents NH₂, R₂ represents 5-CH₃, Y represents N(CH₃)₂ and x is 2.
 - 8. A process for the preparation of a compound represented by the general formula (I), as defined in Claim 1, or an acid addition——salt thereof, which comprises coupling a substituted acridine of——the general formula (II),

10

$$R_2 \longrightarrow 0$$

$$C - R_6$$

where R_2 represents groups as defined in Claim 1, Z represents H, CH₃ or a suitable leaving group and R_6 represents Cl, Br or OC_6H_4 -p- NO_2 , with a primary alkyl amine of the general formula (III),

where x and Y are defined as in Claim 1, and, when Z is a leaving group, converting the resultant coupled product to a compound of general formula (I) where R1 represents NHR3 and R3 is as defined in Claim 1, and, if desired, converting a compound of formula (I) into an acid addition salt thereof.

- 9. A process according to Claim 8 wherein Z in formula (II) represents a leaving group selected from methoxy, phenoxy, alkylthio, and halogen.
- 10. A process according to Claim 8 wherein Z in formula (II) represents chloro.
 - 11. A process according to any one of Claims 8 to 10 wherein R_6 in formula (11) represents C1 or $OC_6H_4-p-NO_2$.
 - 12. A process according to any one of claims 8 to 11 wherein the coupling reaction of compound (II) with compound (III) is performed in an anhydrous solvent selected from chloroform, dimethylsulphoxide, N-methylpyrrolidone, dichloromethane, and dimethylformamide, buffered with a tertiary amine.
- 13. A process according to any one of Claims 8 to 12 wherein Z in formula (II) represents chloro and the resultant coupled product is treated with anhydrous ammonia or amine of the formula R₃NH₂ in phenol or cresol to provide a compound of the formula (I) where R₁ represents NHR₃ and R₃ is defined in Claim 1.
- 14. A process for the preparation of a compound represented by the general formula (I), as defined in Claim 1, in which R₁ represents CH₃, or an acid addition salt thereof, which comprises cyclodehydrating a compound of the general formula (XII')

where x and Y are defined as in Claim 1, and R_2

BNSDOCID: <EP____0098098A2_1_>

10

and R₂" represent hydrogen or together represent up to 2 of the groups CH₃, OCH₃, halogen, CF₃, NO₂, NH₂, NHCOCH₃ and NHCOOCH₃ placed at positions corresponding to positions 1 to 3 and 5 to 8 in the formula (I), and, if desired, converting a compound of formula (I) into an acid addition salt thereof.

- 15. A compound represented by the general formula (I), as defined in Claim 1, or an acid addition salt thereof, whenever prepared by the process according to any one of Claims 8 to 13.
 - 16. A compound of the general formula (II)

5

where R_2 represents H or up to two of the groups CH_3 , OCH_3 , halogen, CF_3 , NO_2 , NH_2 , $NHCOCH_3$, and $NHCOOCH_3$ placed at positions 1-3 and 5-8;

I represents H, CH₃ or a leaving group selected from methoxy, phenoxy, alkylthic, and halogen; and

 R_6 represents Cl, Br or OC_6H_4 -p-NO₂, or an acid addition salt thereof.

17. A compound of the general formula (IX)

where R2 represents H or up to two of the groups CH3, OCH3, halogen, CF3, NO2, NH2, NHCOCH3, and NHCOOCH3 placed at positions 1-3 and 5-8; and R7 represents a lower alkyl group, or an acid addition salt thereof.

- 18. A pharmaceutical preparation having antitumour activity which comprises at least one compound of the general formula (I) defined in Claim 1, or a pharmaceutically acceptable acid addition salt thereof, in admixture or conjunction with one or more pharmaceutically acceptable carriers or diluents.
- 19. A pharmaceutical preparation having antitumour activity which comprises a compound according to any one of Claims 2 to 7 and 15, in admixture or conjunction with a pharmaceutically acceptable acid addition salt thereof, and one or more pharmaceutically acceptable carriers or diluents.
- 20 20. A compound of the general formula (I) as defined in Claim 1, or a pharmaceutically acceptable acid addition salt thereof, for use in the treatment of tumours.

5

10

21. A compound according to any one of Claims 2 to 7 and 15, or a pharmaceutically acceptable acid addition salt thereof, for use in the treatment of tumours.

CLAIMS FOR AUSTRIA:

1. A process for the preparation of a compound represented by the general formula (1),

$$R_1$$
 R_2
 $CONH(Ch_2)_{\chi}$

where

R₁ represents H, CH₃ or NHR₃, where R₃ represents H, COCH₃, SO₂CH₃, COPh, SO₂Ph or lower alkyl unsubstituted or substituted by one or more of the same or different substituents selected from hydroxyl and amino functions;

10

5

 $m R_2$ represents H or up to two of the groups $m CH_3$, $m OCH_3$, halogen, $m CF_3$, $m NO_2$, $m NH_2$, $m NHCOCH_3$ and $m NHCOOCH_3$ placed at positions 1-3 and 5-8;

15

Y represents $C(NH)NH_2$, $NHC(NH)NH_2$, or NR_4R_5 , where each of R_4 and R_5 , which may be the same or different, represents H or lower alkyl unsubstituted or substituted by one or more of the same or different substituents selected from hydroxyl and amino functions; and

x is from 2 to 6,

or an acid addition salt thereof, which process comprises coupling a substituted acridine of the general formula (II),

where R_2 represents groups as defined above, Z represents H, CH3 or a suitable leaving group and R_6 represents C1, Br or $OC_6H_4-p-NO_2$, with a primary alkyl amine of the general formula (III),

- where x and Y are defined as above, and, when Z is a leaving group, converting the resultant coupled product to a compound of general formula (I) where R₁ represents NHR₃ and R₃ is as defined in Claim 1, and, if desired, converting a compound of formula (I) into an acid addition salt thereof.
- 2. A process according to Claim 1 wherein Z in formula (II) represents a leaving group selected from methoxy, phenoxy, alkylthio, and halogen.
 - 3. A process according to Claim 1 wherein Z in formula (II) represents chloro.
- 15 4. A process according to any one of Claims 1 to 3 wherein R_6 in formula (II) represents C1 or $006H_4-p-N0_2$.

20

- 5. A process according to any one of claims 1 to 4 wherein the coupling reaction of compound (II) with compound (III) is performed in an anhydrous solvent selected from chloroform, dimethylsulphoxide, N-methylpyrrolidone, dichloromethane, and dimethylformamide, buffered with a tertiary amine.
- 6. A process according to any one of Claims 1 to 5 wherein Z in formula (II) represents chloro and the resultant coupled product is treated with anhydrous ammonia or amine of the

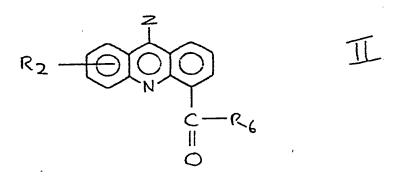

formula R_3NH_2 in phenol or cresol to provide a compound of the formula (I) where R_1 represents NHR_3 and R_3 is defined in Claim 1.

7. A process for the preparation of a compound represented by the general formula (I), as defined in Claim 1, in which R₁ represents CH₃, or an acid addition salt thereof, which comprises cyclodehydrating a compound of the general formula (XII')

$$R_{2}'$$
 R_{2}''
 R_{2}''

- where x and Y are defined as in Claim 1, and R₂' and R₂" represent hydrogen or together represent up to 2 of the groups CH₃, OCH₃, halogen, CF₃, NO₂, NH₂, NHCOCH₃ and NHCOOCH₃ placed at positions corresponding to positions 1 to 3 and 5 to 8 in the formula (I), and, if desired, converting a compound of formula (I) into an acid addition salt thereof.
- 8. A process according to any one of Claims 1 to 7 in which R₁ represents NH₂, R₂ represents up to two of 1-, 5-, 6-, 7-, and 8-NO₂, 5- and 6-CH₃, and 5-Cl, Y represents NHC(NH)NH₂, N(CH₃)₂ or NHCH₂CH₂OH and x is 2.
- 9. A process according to any one of Claims 1 to 7 in which R₁ represents H, R₂ represents up to two of 1-, 5-, 6-, 7-, and 8-NO₂, 5- and 6-CH₃, and 5-Cl, Y represents NHC(NH)NH₂, N(CH₃)₂ or NHCH₂CH₂OH and x is 2.

- 10. A process according to any one of Claims 1 to 7 in which R₁ and R₂ represent H, Y represents N(CH₃)₂ and x is 2.
- 11. A process according to any one of Claims 1 to 7 in which R₁ represents NH₂, R₂ represents H, Y represents N(CH₃)₂ and x is 2.
 - 12. A process according to any one of Claims 1 to 7 in which R_1 represents NH_2 , R_2 represents $6-NO_2$, Y represents $N(CH_3)_2$ and x is 2.
- 10 13. A process according to any one of Claims 1 to 7 in which R₁ represents NH₂, R₂ represents 5-CH₃, Y represents N(CH₃)₂ and x is 2.
 - 14. A process for the preparation of a compound represented by the general formula (II)

15 where R₂ is defined as in Claim 1;

Z represents H, CH₃, Cl, or Br; and

 R_6 represents C1, Br, or OC_6H_4 -p- NO_2 ,

or an acid addition salt thereof, which process comprises reacting a compound of the general

20 formula (VI)

where R₂ is defined as above; and Z represents H, or CH₃, with a halogenating agent or with tris(4-nitrophenyl)phosphite or reacting a compound of the general formula (V)

- where R₂ is defined as above, with a halogenating agent or with tris(4-nitrophenyl)phosphite and then with a halogenating agent, and, if desired, converting a compound of formula (II) into an acid addition salt thereof.
- 10 15. A process for the preparation of a compound represented by the general formula (IX)

$$R_2 \longrightarrow 0$$
 H
 $C \longrightarrow 0$
 $C \longrightarrow 0$
 $C \longrightarrow 0$
 $C \longrightarrow 0$

where R₂ is defined as in Claim 1; and

R₇ represents a lower alkyl group,

'ISDOCID: <EP____0098098A2_I_>

or al acid addition salt thereof, which process comprises ring closing a compound of the general formula (VIII)

in which R₂ and R₇ are defined as above,
and if desired, converting a compound of formula
(IX) into an acid addition salt thereof.

- 16. A process for the preparation of a pharmaceutical preparation having antitumour activity which comprises bringing into admixture or conjunction at least one compound of the general formula (I) defined in Claim 1, or a pharmaceutically acceptable acid addition salt thereof, and one or more pharmaceutically acceptable carriers or diluents.
- 15 17. Use of a compound of the general formula (I) as defined in Claim 1, or a pharmaceutically acceptable acid addition salt thereof, in the treatment of tumours.

- 54 Acridinecarboxamide compounds.
- 57 The novel class of 4-carboxamidoacridines of the present invention represented by the general formula (I),

 R_1 represents H, CH_3 or NHR_3 , where R_3 is H, $COCH_3$, SO₂CH₃, COPh, SO₂Ph or lower alkyl optionally substituted with hydroxyl and/or amino functions;

R₂ represents H or up to two of the groups CH₃, OCH₃, halogen, CF₃, NO₂, NH₂, NHCOCH₃, and NHCOOCH₃ placed at positions 1-3 and 5-8;

Y represents C(NH)NH₂, NHC(NH)NH₂, or NR₄R₅, where each of R4 and R5 is H or lower alkyl optionally substituted with hydroxyl and/or amino functions; and

x is from 2 to 6, and the acid addition salts thereof, possess antibacterial and antitumour properties.
